Conclusions

The implementation of a programming language is a complex task that involves several implementation aspects, such as:

- Syntax and semantics definition
- Type system definition
- Code generation
- Error handling
- IDE support
- Documentation

It is usually done in a **monolithic** way with a **top-down** approach, where all the aspects are tightly coupled.

Conclusions

The implementation of a programming language is a complex task that involves several implementation aspects, such as:

- Syntax and semantics definition
- Error handling
- IDE support
- Type system definition
- Documentation
- Code generation

It is usually done in a **monolithic** way with a **top-down** approach, where all the aspects are tightly coupled.

This makes the **maintainability**, **extensibility** and **reusability** of the implementation difficult.

Conclusions

In 2016, Microsoft in collaboration with Red Hat introduced the Language Server Protocol (LSP) and the Debugger Adapter Protocol (DAP).

The LSP and DAP are JSON-RPC based protocols that allow the communication between a Language Server and an IDE.

Intrinsic properties:

- Language-agnostic
- IDE-agnostic
- Asynchronous
- Text-Based

Features:

- Diagnostics
- Hover
- Go to definition
- Find references

Conclusions

Since 1990s, researchers have been working on the concept of **Software Product Lines** (SPLs) to move towards a more **modular** world.

- SPLs defines a **family** of software products.
- SPLs is described by a **Feature Model**.
- A Feature Model describes the **variability** of the software.
- SPL **variants** are generated by selecting a set of features.
- A **feature** (or **artifact**) is a first-class entity in SPLs.
